Safety certification

2024 July

Safety certification

- lacktriangle UN 38.3 for maintaining the safety of the Lithium Ion Battery during shipping \Rightarrow Certified
- IEC62133 for the standard safety testing \Rightarrow Certified

	Test items	Test contents	Criteria	Results
٦	Reduced Pressure	Simulate low pressure condition during air transportation	No damage Open Circuit Voltage (OCV) to be more than 90% of initial value	ОК
} Certification】	Temperature	Simulate extreme temperature change	No damage Open Circuit Voltage (OCV) to be more than 90% of initial value	ОК
3 y Certi	Vibration	Simulate vibration during transport	No damage Open Circuit Voltage (OCV) to be more than 90% of initial value	ОК
UN 38.3	Impact	Simulate impact during transport	No damage Open Circuit Voltage (OCV) to be more than 90% of initial value	ОК
UN	External short- circuit	Test for external short circuit	Not to exceed 170°C No damage during or 6 hours after the testing	ОК
Fransp	Crush	Simulate collision with heavy item	Not to exceed 170°C No damage during or 6 hours after the testing	ОК
	Forced discharge	Simulate forced discharge condition	No damage during or after 7 days of testing	ОК
	Test items	Test contents	Criteria	Results
[s]	Constant voltage charging	Constant charging with design value for 28 consecutive days to confirm abnormality, ex. Fire etc.	No rupture or ignition	ОК
62133 Safety Standards]	External short- circuit	Check for possible ignition with external short circuit under $100 m\Omega$	No rupture or ignition	ОК
62133 Safety St	Free fall	Drop from height of 1m	No rupture or ignition	ОК
g 23		Check for possible ignition after 10 min. heating at 130°C	No rupture or ignition	ОК
EC 6	Heating	Check for possible ignition after 10 min. heating at 150 C	No rupture or ignition	UK UK
IEC (International S	Impact	Check for possible ignition with the impact of peak acceleration rate of 175g	No rupture or ignition	ОК

Safety of EnerCera is confirmed.

Safety bullying test items and results_EnerCera Pouch

	Expected usage	What to expect	Test items	Test contents	Pass/Fail Judgment	progress
	Simulate charging due to miscontrol when charging externally	Ignition, explosion	Overcharge	Charging at 30mA at 60 $^{\circ}\!\!\mathrm{C}$	No ignition or explosion	Passed : No fire
Electrical factors	Simulate leaving with external circuits formed Simulate charging due to built-in mistake (positive/negative electrode reverse) Simulate discharging due to charging by control error	Rupture due to gas generation, Electrolyte scattering	Overdischarge	Discharging at 30mA at 60 $^{\circ}\!$	No rupture or liquid scattering	Passed : No fire
	Simulate external circuit (low resistance) formed	Ignition, explosion	External short-circuit	Cell voltage 4.3V, Temperature: $60^{\circ}\!$	No ignition or explosion	Passed : No fire
	Simulate internal short circuit by Li electrolytic precipitation (low temperature, high rate and large ⊿Soc)	Ignition and explosion due to internal shorts	Charge/discharge cycle → internal short circuit	Continue the charge-discharge cycle at 30mA at -20 $^{\circ}\!$	No ignition or explosion	Passed : No fire
	When external charging, large voltage application is assumed due to control error	Ignition, explosion	Overvoltage	Apply to 24V and continue charging at $60^{\circ}\mathrm{C}$	No ignition or explosion	Passed : No fire
<u>r</u>	Foreign matter is assumed to penetrate	Ignition, explosion	Nail penetration	Nail penetration Cell voltage: 4.15V, Temperature: $60^{\circ}\!\mathrm{C}$	No ignition or explosion	Passed : No fire
acto	Trampling, stepping on with high heels, etc., assuming destruction in garbage trucks	Ignition, explosion	Crush	Collapse in the thickness direction Cell voltage: 4.3V, Temperature: 60°C	No ignition or explosion	Passed : No fire
Mechanical factors	Simulate falling of item on battery Simulate falling of heavy item on item on battery	Ignition, explosion	Impact	Iron 9.6 kg weight is dropped from a height of 100 mm. Cell voltage: 4.3V, Temperature: room temperature	No ignition or explosion	Passed : No fire
Mecha	Simulate folding	Ignition, explosion	Folding	Folding Cell voltage: 4.3V, Temperature: 60° C	No ignition or explosion	Passed : No fire
	Simulate cutting with scissors, etc.	Ignition, explosion	Cutting	Voltage: 4.3V, Temperature: 60°C	No ignition or explosion	Passed : No fire
S	Simulate airplane boarding Simulate use in low-pressure environments	Leaks, explosion	Under reduced pressure	0.6 kPa or less 12 Hr or more	No leakage or explosion	Passed : No fire (UN Tested)
actol	Simulate submerged seawater, bath, washroom, hand washing, toilet	Ignition, explosion	Immersion in water	Immerse in 3.5wt.%NaCl solution at 4.3V and pulled out of the solution and kept at 3.0V	No ignition or explosion	Passed : No fire
I fe	Simulate submerged in hot water and oil	Ignition, explosion	Hot oil	Put in heated oil at 4.3V	No ignition or explosion	Passed : No fire
Environmental factors	Simulate heating with kotatsu, heater or stove	Ignition, explosion	Heating	Heating on a hot plate . Cell voltage:4.15V (Confirm by increasing the temperature gradually)	No ignition or explosion	Passed : No fire
	Simulate thermal shock	Ignition, explosion	Thermal shock	-20 $^{\circ}$ C \Leftrightarrow 50 $^{\circ}$ C \times 30cycle (Each temperature held for 10 min.) Cell voltage 4.15V	No ignition or explosion	Passed : No fire
Env	Simulate a flame on a stove, burner, etc.	explosion	Burning	Put in a flame. Cell voltage:4.3V	No explosions or scattering	Passed : No fire
	Simulate heating in a microwave	Ignition, explosion	Microwave heating	Heating in a microwave . Cell voltage:4.3V	No explosions	Passed : No fire

Safety of EnerCera Pouch

Examples for Abuse Tests

■ Folding Test

Almost no temperature rise

Penetration Test

Temperature rise approx. 6°C

(Without ignition)

Safety bullying test items and results _EnerCera Coin

■ Possible accidents and corresponding test items

	Expected usage	What to expect	Test items	Test contents	Pass/Fail Judgment	progress
Electrical factors	Assumed to continue charging due to miscontrol when charging externally	Ignition, explosion	Overcharge	Temperature: Continue charging at 100mA in an 85°C environment until an event is confirmed	No ignition or explosion	Passed : No fire
	Assume leaving with external circuits formed Assumed to continue discharging due to charging control error	Rupture due to gas generation, Electrolyte scattering	Overdischarge	Temperature: Continue to discharge at 50mA in an environment of 85°C until the event is confirmed	No rupture or liquid scattering	Passed : No fire
	Assuming that an external circuit (low resistance) has been formed	Ignition, explosion	External short-circuit	Voltage: 2.7V, Temperature: Connecting poles with conductors in an environment of 85°C	No ignition or explosion	Passed : No fire
	When external charging, large voltage application is assumed due to control error	Ignition, explosion	Overvoltage	Temperature: Apply to 24V in an environment of 85°C and continue charging until the event is confirmed	No ignition or explosion	Passed : No fire
Mechanical factors Environmental factors	Foreign matter is assumed to penetrate	Ignition, explosion	Nail biting	Voltage: 2.7V, Temperature: Nailing in 85°C environment	No ignition or explosion	Passed : No fire
	Trampling, stepping on with high heels, etc., assuming destruction in garbage trucks	Ignition, explosion	Crushing	Voltage: 2.7V, Temperature: under 85°C environment Thick direction crushing	No ignition or explosion	Passed : No fire
	Assuming objects fall on batteries Assumption of heavy objects falling with objects on top assuming you're hitting something	Ignition, explosion	Impact	Voltage: 2.7V, Temperature: Under room temperature environment Iron 9.1kg weight dropped from 610±25mm height	No ignition or explosion	Passed : No fire
	Assuming airplane boarding Intended for use in low-pressure environments	Leaks, explosions	Low pressure	Low pressure: 11.3 kPa or less 6Hr or more	No leakage or explosion	Passed : No fire
	Assuming heating with kotatsu, heater, or stove	Ignition, explosion	Heating	Voltage: Heating in hot plate at 2.7V (Check by raising the temperature step by step)	No ignition or explosion	Passed : No fire
	Assuming a low-temperature and high-temperature environment	Ignition, explosion	Thermal shock	Voltage: Put in thermal shock tank at 2.7V -40°C ⇔ 72°C × 10 cycles (temperature holding 6Hr)	No ignition or explosion	Passed : No fire
	Assume an open fire on a stove, burner, etc.	explosion	Fire broiling	Voltage: Put in flames at 2.7V	No explosions or scattering	Passed : No fire
	Assuming heating in a microwave oven	Ignition, explosion	Microwave heating	Voltage: Microwave at 2.7V	No explosions	Passed : No fire

Safety of EnerCera Coin

Nail biting test

After the test

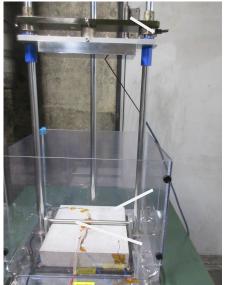

Fully charged, nailed in a high temperature environment of 85°C

 \Rightarrow Temperature rise is 1.3°C, no ignition

Impact test

During the test

After the test

Drop a weight of 9 Kg from a height of 60 cm with a stainless steel round bar on top_※

 \Rightarrow Temperature rise is 0.6°C, no ignition

XJIS C 8715-2

Industrial Lithium Secondary Battery Single Battery and Battery Systems: Safety Requirements

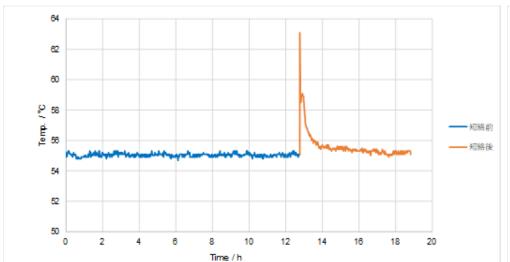

Example of safety test External short-circuit

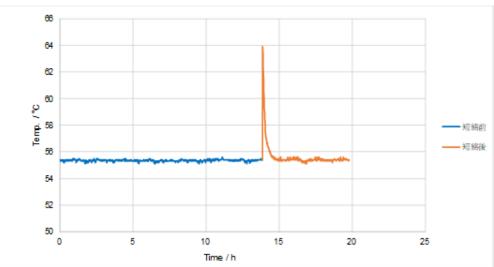

Test condition

Heat the battery to 57 \pm 4°C and hold for at least 6 hours. Then the total external resistance is shorted to less than 0.1 Ω , the short-circuit condition continues for more than 1 hour after the temperature returns to 57 \pm 4°C. (Sample is fully charged, after T1~T4 test)

Short circuit when fully charged at high temperature (55 $^{\circ}$ C)

ightarrowTemperature rise is approximately 8°C, no ignition

*Although it is a discontinued number, the capacity, voltage, and energy are equivalent to the largest current number, EC382704P-T, so we assume that the current part number will not be a problem.

Short circuit when fully charged at high temperature (55 $^{\circ}$ C)

ightarrowTemperature rise is approximately 9°C, no ignition

*This data is for reference only and is not guaranteed by the Company.
